

TRAVIS TINCHER

Senior Software Engineer — Ruby on Rails · full stack · AI agents

tincher.travis@gmail.com · (903) 574-1520 · linkedin.com/in/travis-tincher · github.com/trtincher · Philadelphia, PA (Eastern) · remote

SUMMARY

Full-stack engineer, six years in production, with Ruby on Rails and PostgreSQL at the core of the backend work and a record of shipping third-party and LLM integrations into regulated workflows. For the past year I have also built and operated an autonomous, agent-driven development system, so I know where AI tooling helps, where it lies, and how to test it.

SELECTED WORK — AUTONOMOUS AGENT DEV SYSTEM · 2025 – PRESENT

- Built and run a two-mode agent system for shipping software. Live mode: an orchestrator session (frontier model) plans the work, briefs parallel worker agents in isolated git worktrees, routes the model per task, and lands their output as a stacked PR graph with one human gate. Background mode: a queue-driven runner executes one headless LLM session per task from a pinned checkout for overnight and batch work.
- Twelve months in continuous operation: about 3,500 tasks and 640+ merged PRs across multiple repos, run fully autonomously with strategic human review gates; a multiplayer game beta shipped through it.
- Wrote the operating rules from what broke: a self-modification race led to a pinned checkout; unreviewable PRs led to small reviewable PRs per wave of work; gates that lied led to per-task verify commands and a headed browser pass after UI work.

SKILLS

- **Backend:** Ruby, Rails 5–7, PostgreSQL, SQL, Active Job / SQS, aasm, REST, GraphQL, RSpec, Node.js / NestJS / TypeScript
- **Frontend:** TypeScript / JavaScript, React, HTML, CSS, Tailwind, Rails views, accessibility, design systems
- **AI agents:** orchestrator / worker patterns, worktree isolation, per-task model routing, Claude Code and headless Claude pipelines, OpenAI API, Texttract, prompt engineering, agent evaluation
- **Deployment and quality:** AWS (ECS, RDS, S3, SQS, Texttract), Terraform, GitHub Actions CI/CD, Docker, Sentry, automated testing, code review, feature-flag deployments

EXPERIENCE

Deep Seas Development — Ruby on Rails Engineer (contract)

Jan 2025 – May 2025, Apr 2026 – Present · remote

- Upgraded two consumer-facing legacy Rails applications from Ruby 2 / Rails 5 to Ruby 3 / Rails 7, adding test coverage, structured error logging, and documentation so the upgrades shipped without regressions.
- Maintain NestJS / TypeScript services on PostgreSQL alongside the Rails work; GitHub Actions CI/CD, AWS via Terraform.

Artisight — Senior Frontend Software Engineer

May 2025 – Jan 2026 · remote

- Built clinician-facing React / TypeScript apps for an AI smart-hospital platform (virtual nursing and observation console, admin and configuration tooling, patient-room bedside interface) deployed at NYU Langone, Johns Hopkins, Mayo Clinic and 30+ health systems.
- Shipped real-time features over WebSocket and WebRTC (two-way audio/video, live sensor and location events) and surfaced AI alerts and predictions to nurses with explicit uncertainty and failure states, so a wrong signal could not pass for a right one.
- Owned frontend testing and release verification (Jest, introduced Playwright, browser checks before and after release in live hospitals); built to the design system with accessibility as a hard requirement.

Alix — Founding Full Stack Engineer (estate-settlement platform)

May 2023 – Dec 2024 · remote

- Designed and shipped an LLM document pipeline (S3 + Texttract + OpenAI) that classifies and auto-sorts hundreds of scanned estate documents per client, with batching for production volume and a prompt-engineered table-of-contents output. Cut manual processing 80%, about 15 hours per client.
- Moved the team from bottlenecked manual QA to weekly feature-flagged releases: integrated the flag system, rebuilt the Jira automation, taught the process. Defects fell 70%, hotfixes nearly disappeared.
- Built the React / TypeScript client and admin portal from scratch with a design system; GraphQL codegen and form generators cut interface and admin-form work 65% and 90%.

JMJ Financial

Feb 2021 – Jan 2023 · remote

Ruby on Rails Engineer, backend lead · Feb 2022 – Jan 2023

- Architected the Rails / PostgreSQL backend for a mortgage platform on AWS: ECS web and worker services, Active Job on SQS, RDS in high availability, encrypted S3 via Active Storage, Sentry and CloudWatch.
- Built the Mortgage Disclosures feature end to end: Encompass and HelloSign integrations, an aasm state machine per document, webhooks for the event-driven approval flow, and Rails views for loan officers. A multi-hour manual process became a background job with two review touchpoints (~60% less manual overhead).
- Designed the REST APIs for three client portals; shipped Auth.net and PDFtron integrations; led a project with an external contractor.

Full Stack Ruby on Rails Engineer · Feb 2021 – Jan 2022

- Built the Rails API layer and page-data hydration for the React client and internal Rails pages; shipped the digital loan application (Form 1003) end to end; owned CI/CD and pre-launch QA.

EDUCATION

General Assembly, Software Engineering, 2020 · Emory University, M.T.S., 2015 · Texas A&M, B.A. Philosophy, 2012
